

MASKING STRIP

Abstract

A foam masking strip for masking a gap between two relatively movable parts
5 such as a door and a door post of a vehicle comprises a flexible web connecting
two lobes. The web is provided with an adhesive stripe for securing the
masking strip to one of the parts and is of reduced thickness permitting
independent movement of the lobes relative to each other. In this way, the
masking strip can adapt to different gap sizes without compromising the
10 interface between each lobe and the surface of the adjacent part of the vehicle.
